

AMENDMENTS TO THE CLAIMS:

Please cancel claims 4-5 without prejudice or disclaimer and amend the claims as follows:

1. (Currently Amended) A cell search determination circuit, wherein a mobile station in W-CDMA cellular communications confirms a scramble code identified by cell search, comprising; comprising:
 - first correlation means for correlating the scramble code and a receiving signal;
 - second correlation means for correlating a first synchronous channel code and the receiving signal;
 - average operation means for generating a phase vector in which noise components of an output from the first correlator are suppressed;
 - first power addition means for acquiring a power of the first correlation means using the phase vector and performing integration;
 - second power addition means for acquiring a power of the second correlation means using the phase vector and performing integration;
 - threshold operation means for outputting a threshold value corresponding to an output from the first power addition means; and
 - comparison means for making a threshold determination of an output from the second power addition means using the threshold value.
2. (Original) The cell search determination circuit as claimed in claim 1, wherein the threshold operation means outputs a threshold value based on a transmission level ratio of the first synchronous channel code to the scramble code.

3. (Original) A cell search determination circuit, wherein a mobile station in W-CDMA cellular communications confirms a scramble code identified by cell search, comprising:
 - first correlation means for correlating the scramble code and a receiving signal;
 - second correlation means for correlating a first synchronous channel code and the receiving signal;
 - third correlation means for correlating a second synchronous channel code and the receiving signal;
 - average operation means for generating a phase vector in which noise components of an output from the first correlation means are suppressed;
 - first power addition means for acquiring a power of the first correlation means using the phase vector and performing integration;
 - second power addition means for acquiring a power of the second correlation means using the phase vector and performing integration;
 - third power addition means for acquiring a power of the third correlation means using the phase vector and performing integration;
 - second threshold operation means for outputting a second threshold value corresponding to an output from the second power addition means;
 - first comparison means for making a threshold determination of an output from the third power addition means using the second threshold value;
 - first threshold operation means for outputting a first threshold value corresponding to an output from the first power addition means; and
 - second comparison means for making a threshold determination of an output from the first comparator using the first threshold value.

4.-5. (Canceled)
